

INKINGI RESCUE

Emergency Response at your fingertips

Incident Heatmap

Geographic distribution of incidents across Rwanda with severity-based intensity

PROJECT OVERVIEW

INKINGI Rescue is a next-generation emergency response platform designed to improve how emergencies are reported, dispatched, and managed across Rwanda. The system connects citizens, hospitals, emergency responders, and government institutions into one coordinated ecosystem.

It solves the current challenges of slow reporting, lack of location-based coordination, and fragmented communication among responders. Using real-time alerts, geolocation, data analytics, and automated routing, INKINGI Rescue ensures that help reaches people faster and more efficiently.

Our mission is simple: reduce response time, save more lives, and modernize emergency management nationwide.

PROJECT FEATURES

- **One-Tap Emergency Alerts:** Users can instantly report medical, fire, security, or accident emergencies from the mobile/web app.
- **Location-Based Dispatching:** The system automatically identifies the nearest responders, hospitals, and relevant institutions based on the user's district and GPS location.
- **District-Level Notification System:** Alerts are routed to the correct district responders to avoid delays and ensure accurate coordination.
- **Responder Dashboard:** Police, health workers, firefighters, ambulance teams, and district officers get dedicated dashboards to track ongoing emergencies.
- **Admin Console:** National-level administrators monitor trends, manage institutions, and generate reports.
- **Offline & Low-Bandwidth Support:** For rural and remote communities via USSD.
- **Multi-Language Interface:** English, Kinyarwanda, and French support for inclusivity
- **Audit Logs & Case History:** Complete record of all incidents for accountability and reporting.
- **Media Proof uploading:** Each reported case will be attached with media proof (Images, videos and audio notes) to clarify the emergent reported
- **Panic Alert Triggering:** The mobile app is equipped with shake cycles sensing that listens and identify if a user has shook their mobiles a couple of times to trigger an urgent emergency.
- **Community based:** Our project is intended to be notifying people within the sector you are currently in that you have faced a problem, so that they might volunteer to help, as the **responders** are on their way
